

How IoT is helping cities become more sustainable

Peter Horvath

October 2022

What makes a city smart?

Utility Monitoring and Control

- Electric meters
- Water meters
- Gas meters

Municipal Infrastructure

- Street lighting
- Traffic lights
- Weather stations
- Environmental sensors
- Parking

Energy production

- Microgrids
- Renewables
- Electric vehicle equipment

Smart Water Distribution - Minimizing Losses and Improving Efficiency

- Water is a critical and valuable resource
- Water leaks and thieving -> huge financial impact
 - As much as 40% is “non-billable”
- Leaks raise electric usage at pump stations
- Smart Meters improve water management
- Sensors across the network improve efficiency

Long-Range IoT Protocols vs Mesh Networks

■ Building ● Base station ● Covered devices
● Isolated devices ● Base station RF range

LONG-RANGE IOT PROTOCOL

Star topology includes expensive base stations (LoRa, Sigfox, NB-IoT...)

In an urban environment or RF challenging layout, deploying enough base stations to cover the entirety of an area is tedious.

■ Building ● Base station ● Covered devices
● Mesh router ● Isolated devices ● Base station RF range

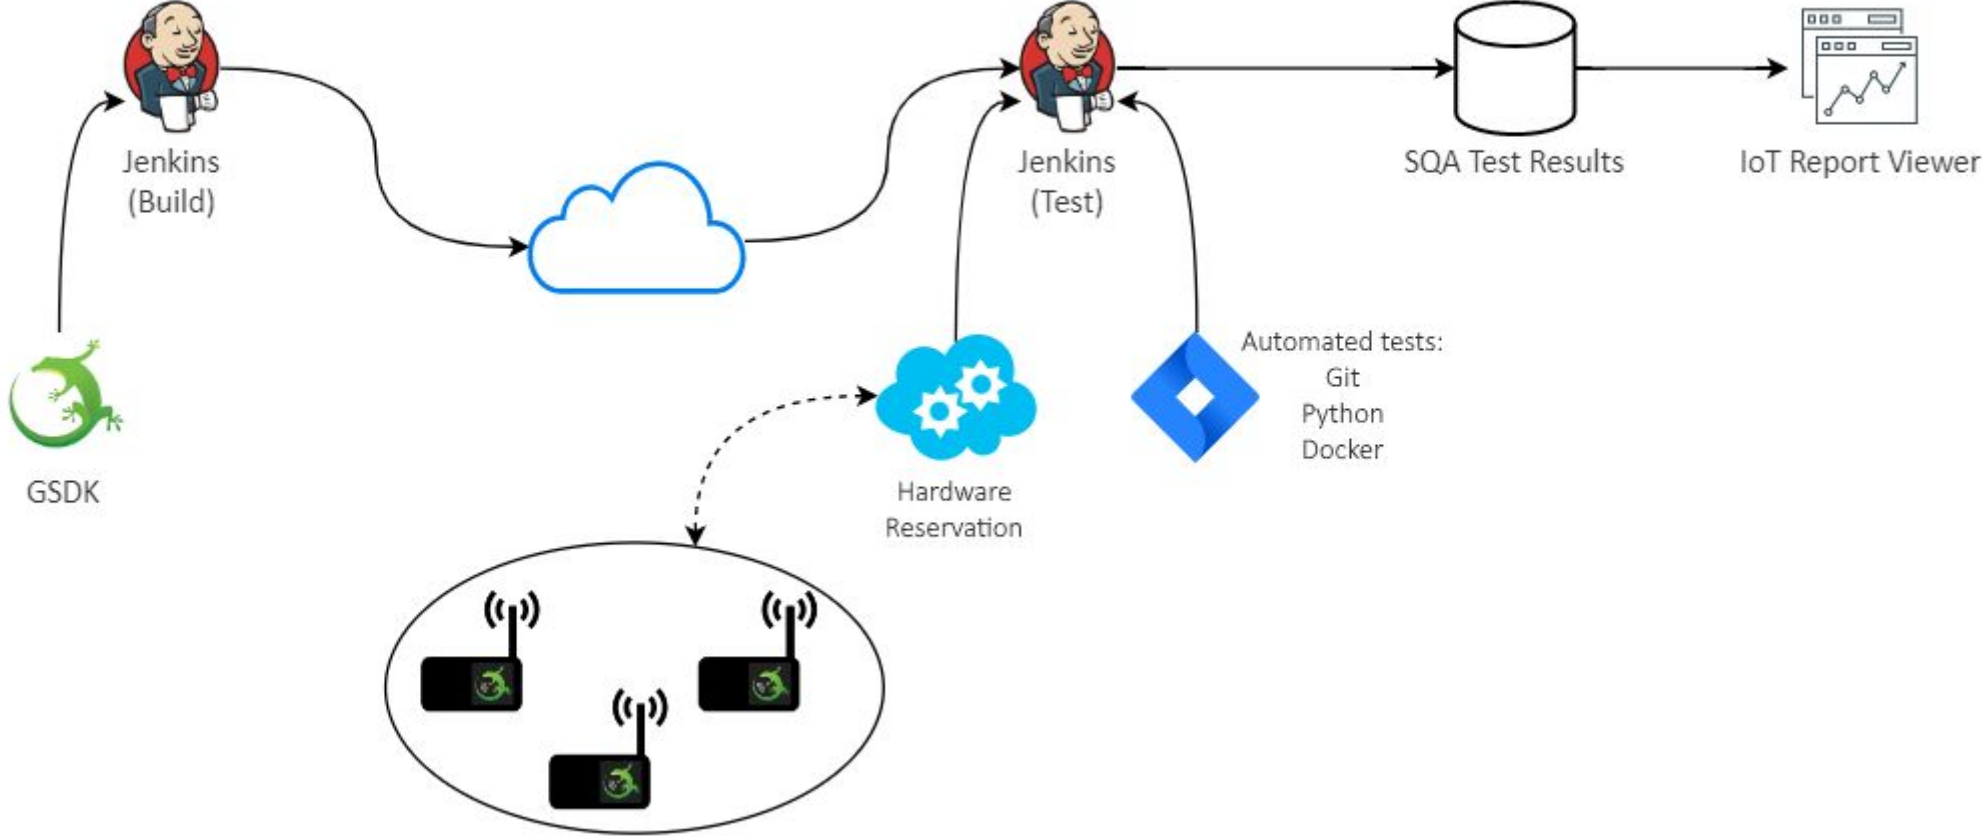

MESH NETWORK PROTOCOL

Mesh topology is more flexible (Wi-SUN/Thread/Bluetooth Mesh...)

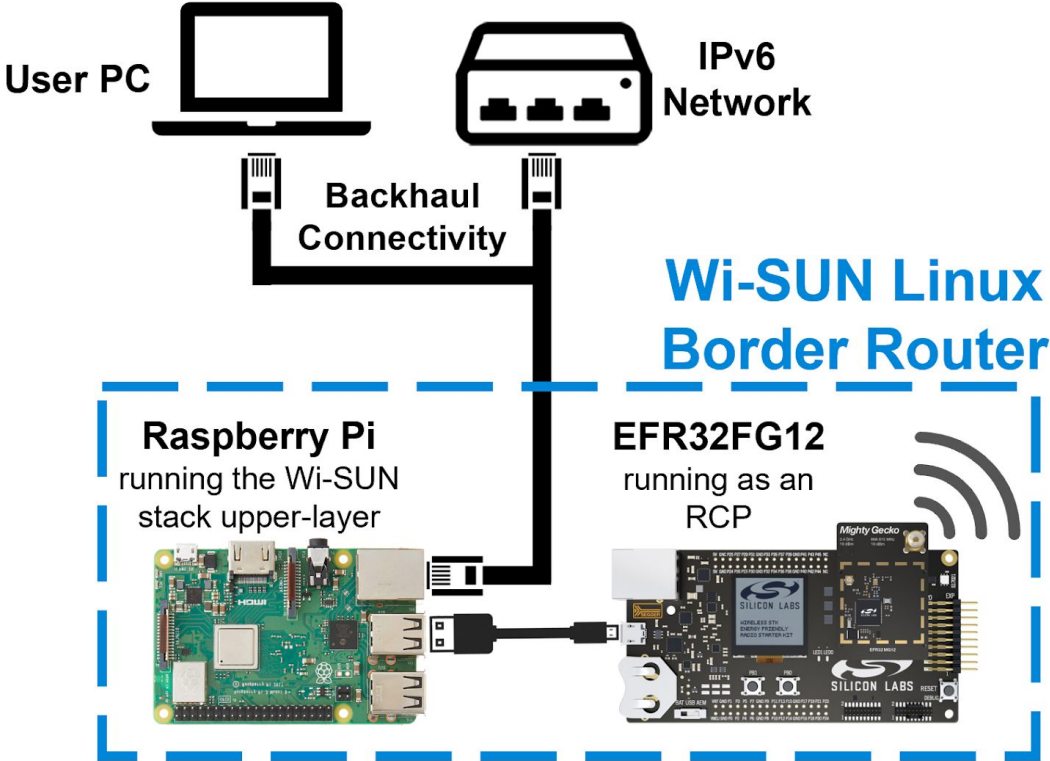

The device range is around 700-800m in the lowest data rate (50 Kbps FSK)

Having a complete RF coverage of such an area becomes possible

Wi-Sun testing

Test automation - networks

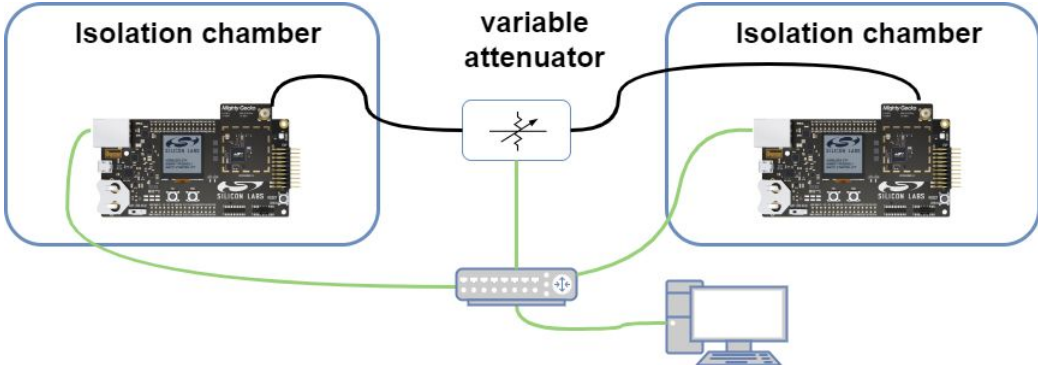

Test automation challenges

Self-healing

Simulating distance

Thank you
